The ocean and global climate

The ocean, with its large heat capacity, has absorbed **more than 90%** of the heat gained by the planet between 1971 and 2010.

■ Cryosphere Entities

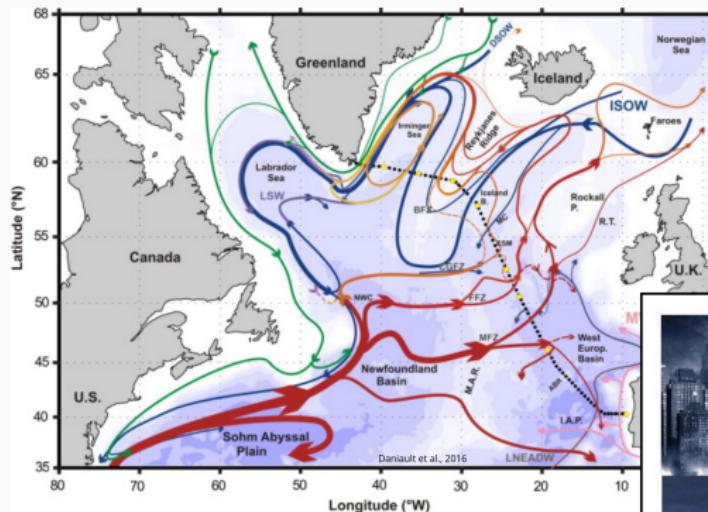

■ Circulation Patterns

■ Biosphere Components

Köppen Climate Classification

Ar	Am	Aw	As	BS	BW	Cr	Cs	Cw	Do	Dc	Eo	Ec	FT	Fl
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

The ocean and global climate: Atlantic

Atlantic Meridional Overturning Circulation (AMOC):

- Thermohaline
- Heat transport to Europe
- Atmospheric patterns
- Drought in Europe
- Sea level USA East coast
- Hurricanes

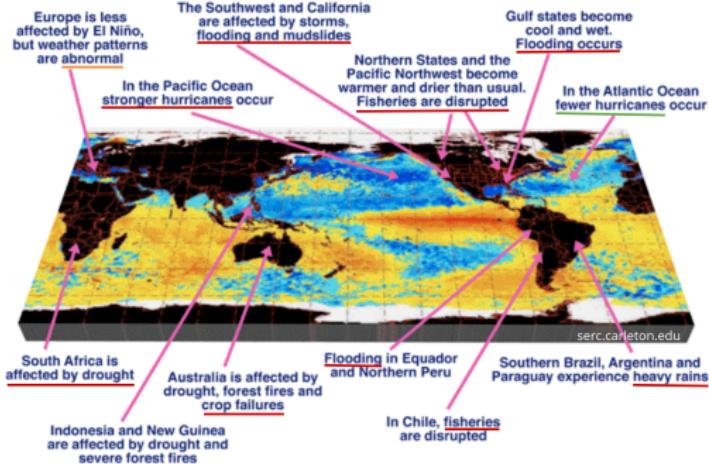

Often assessed with bulk metric:

One number to describe complex currents

The ocean and global climate: ENSO

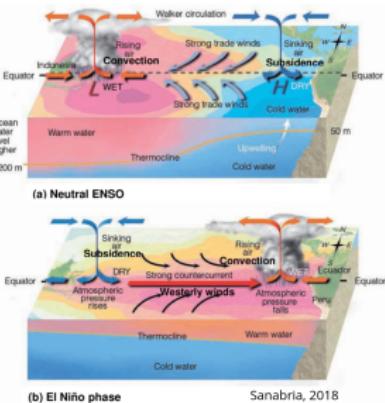

The Global Impact of El Niño

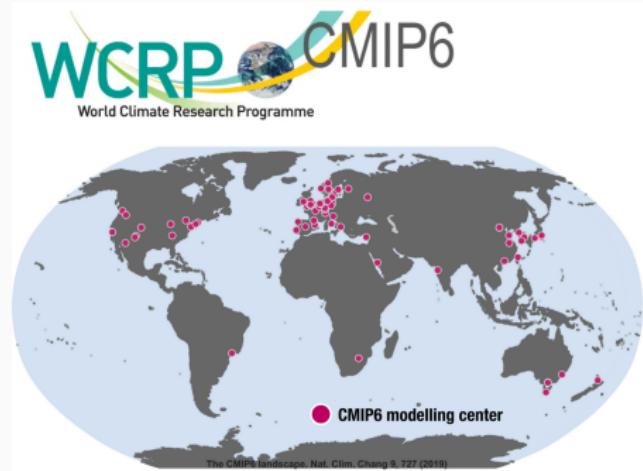

Often assessed with bulk metric:

One number to describe complex phenomena

- Global climate mode
- Complex interplay of circulation
- Profound ocean impact

Climate modelling

Coupled Model Intercomparison Project (CMIP)

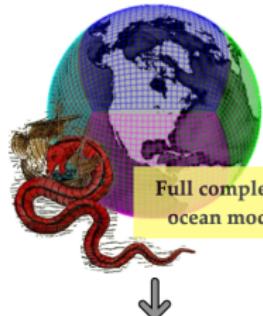

- Standard experiment framework
- Comprehensive climate simulations
- Allows direct comparison of models
- Global participation

Lots of data; hard to store+disseminate; hard to analyze

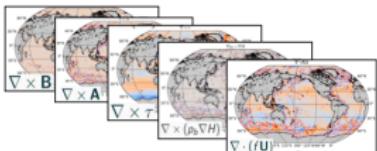

Models used here: IPSL-CM6-LR [1], ESM4 [2], etc.

Tracking Global Heating with Ocean Regimes (THOR)

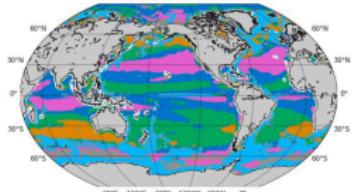

A) Clustering ocean dynamical regimes

Data Transform: Barotropic vorticity space

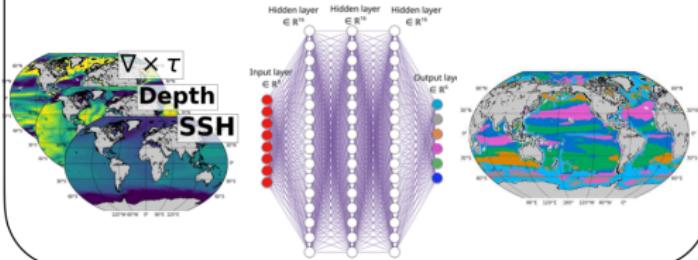

K-means clustering + AIC/BIC validation

B) Supervised learning using labeled ocean dynamical regimes

With different inputs, training a classifier using labels from step A

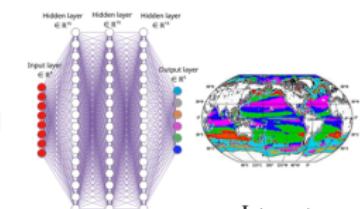

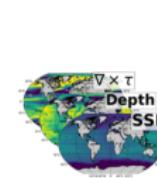

C) Tracking the effect of global Heating on Ocean Regimes (THOR)

Predict ocean regimes of models with no access to in-depth ocean data

New ocean model of interest

→ Extract input data needed for the classification

→ Run the trained classifier from step B

→ Interpret inferred dynamical regimes

Tracking Global Heating with Ocean Regimes: A

Primitive equations

$$\frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} - f v = -\frac{1}{\rho_0} \frac{\partial p}{\partial x} + \frac{\partial}{\partial x} \left(K_x \frac{\partial u}{\partial x} \right) + F_{ux} \quad \text{Momentum (u component)}$$

$$\frac{\partial v}{\partial t} + \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} + fu = -\frac{1}{\rho_0} \frac{\partial p}{\partial y} + \frac{\partial}{\partial y} \left(K_y \frac{\partial v}{\partial y} \right) + F_{vy} \quad \text{Momentum (v component)}$$

$$\frac{\partial \rho}{\partial t} = -\rho \theta \quad \text{density}$$

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0, \quad \text{continuity}$$

$$\frac{\partial \theta}{\partial t} + u \frac{\partial \theta}{\partial x} + v \frac{\partial \theta}{\partial y} + w \frac{\partial \theta}{\partial z} = \frac{\partial}{\partial z} \left(K_z \frac{\partial \theta}{\partial z} \right) + F_\theta \quad \text{Advection of temperature}$$

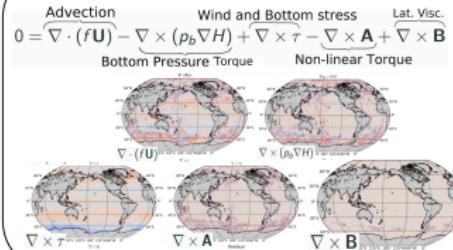

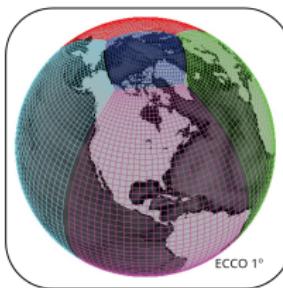

$$\frac{\partial S}{\partial t} + u \frac{\partial S}{\partial x} + v \frac{\partial S}{\partial y} + w \frac{\partial S}{\partial z} = \frac{\partial}{\partial z} \left(K_z \frac{\partial S}{\partial z} \right) + F_S \quad \text{Advection of salinity}$$

$$\rho = \rho(\theta, S) \quad \text{Density as a function of S and T}$$

Ocean model that follows laws of physics

Huge number of 3D fields

Use theory to reduce dimensions and enhance interpretability

Arrive at five 2D fields, representing equation space

With clustering ask:
Are there patterns?

Sonnewald et al. 2019

Tracking Global Heating with Ocean Regimes: A

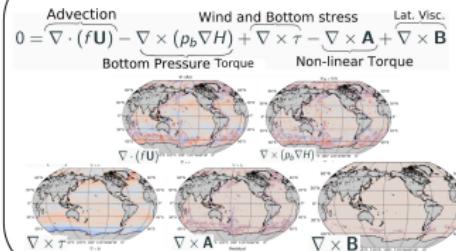

Primitive equations

$$\begin{aligned}\frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} - f v &= -\frac{1}{\rho_0} \frac{\partial p}{\partial x} + \frac{f}{\rho_0} \left(K_x \frac{\partial^2 u}{\partial z^2} \right) + F_{u0} && \text{Momentum (u component)} \\ \frac{\partial v}{\partial t} + \frac{\partial v}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial v}{\partial z} + f u &= -\frac{1}{\rho_0} \frac{\partial p}{\partial y} + \frac{f}{\rho_0} \left(K_y \frac{\partial^2 v}{\partial z^2} \right) + F_{v0} && \text{Momentum (v component)} \\ \frac{\partial T}{\partial t} - \rho_0 \frac{\partial p}{\partial z} &= -\rho_0 g && \text{density} \\ \frac{\partial S}{\partial t} + \frac{\partial S}{\partial x} + \frac{\partial S}{\partial y} + \frac{\partial S}{\partial z} &= 0 && \text{continuity} \\ \frac{\partial T}{\partial x} + \frac{\partial T}{\partial y} + \frac{\partial T}{\partial z} + \frac{\partial T}{\partial z} &= \frac{f}{\rho_0 C_p} \left(K_z \frac{\partial^2 T}{\partial z^2} \right) + F_T && \text{Advection of temperature} \\ \frac{\partial S}{\partial x} + \frac{\partial S}{\partial y} + \frac{\partial S}{\partial z} + \frac{\partial S}{\partial z} &= \frac{f}{\rho_0 C_s} \left(K_z \frac{\partial^2 S}{\partial z^2} \right) + F_S && \text{Advection of salinity} \\ \rho = \rho(T, S) & && \text{Density as a function of S and T}\end{aligned}$$

Interpretable AI [5]

Tracking Global Heating with Ocean Regimes: A

K-means+
strict statistical and
geoscientific criteria

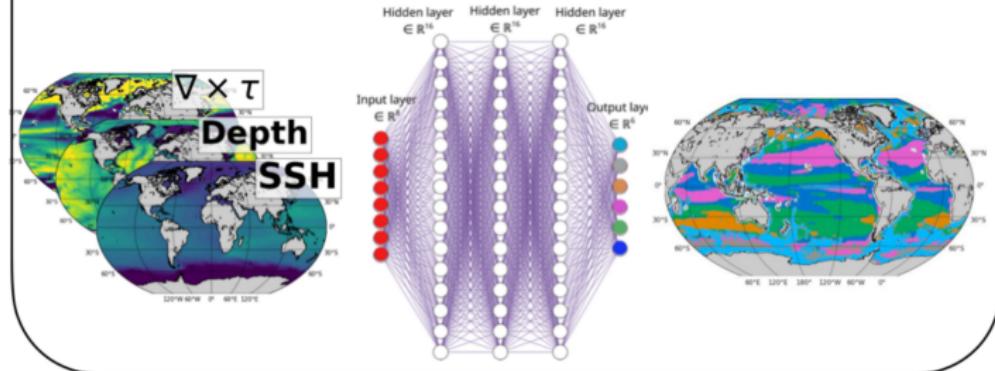

Map onto
climatically key
features

Tracking Global Heating with Ocean Regimes: B

B) Supervised learning using labeled ocean dynamical regimes

With different inputs, training a classifier using labels from step A

Engineer dataset

Input **theory informed**:

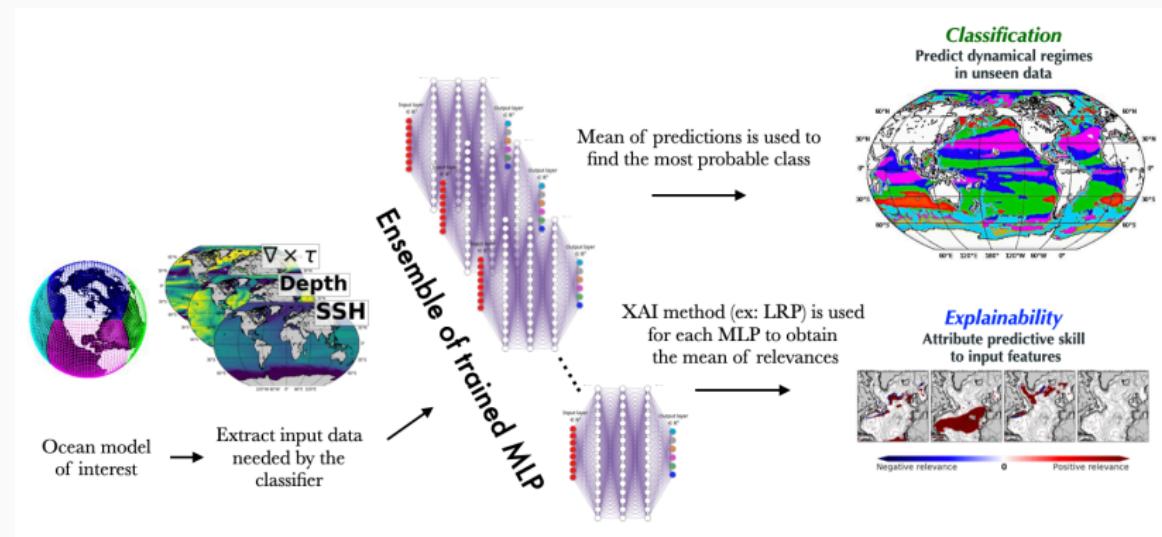

1. Wind stress
2. Sea surface height+grads
3. Depth+grads

Labels: Dynamical regimes (**Step A**)

Train Ensemble MLP

- **Ensemble of 50 MLPs:** same architecture, different initialization
- MLP: 4 layers, 24-24-16-16 neurons
- Keras-tuner for Hyperparameters
- Class prediction: **Average softmax probabilities** of the Ensemble MLP

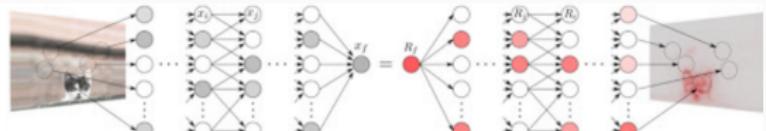

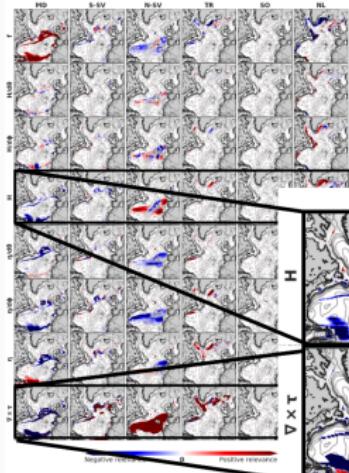

Tracking Global Heating with Ocean Regimes: B

Sonnewald and Lguensat 2021 [3]

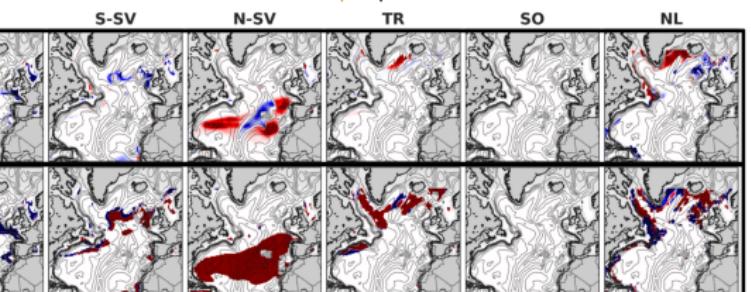

Tracking Global Heating with Ocean Regimes: B

Additive Feature Attribution:
Explainable AI (XAI)

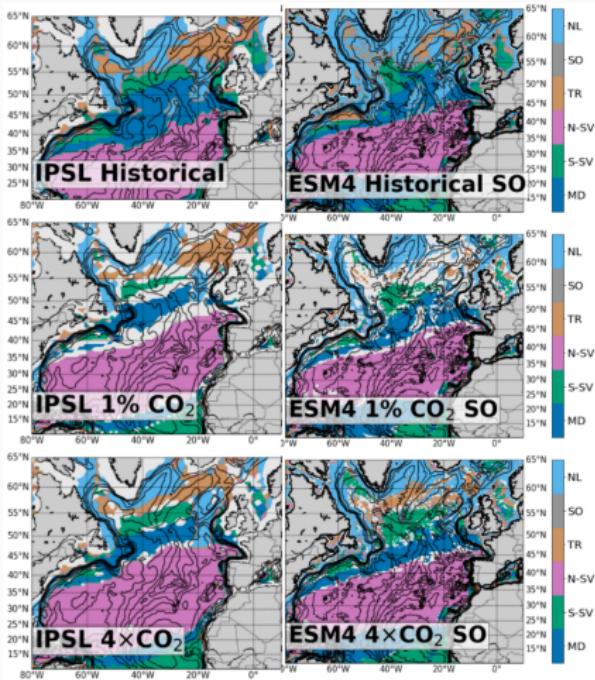

Layerwise Relevance Propagation (LRP)

- Dynamical regime (horizontal) by input feature (vertical)
- Relevance mean of ensemble LRP estimation
- Pos/Neg regions **conform with expectations from theory**
- Avoid **underspecification** (D'Amour et al., 2020)
- Confidence in **out-of-sample** prediction ← All climate simulation

Negative relevance 0 Positive relevance

Tracking Global Heating with Ocean Regimes: C

Circulation is known to weaken with climate change: Mechanisms?

Two example IPCC climate models:

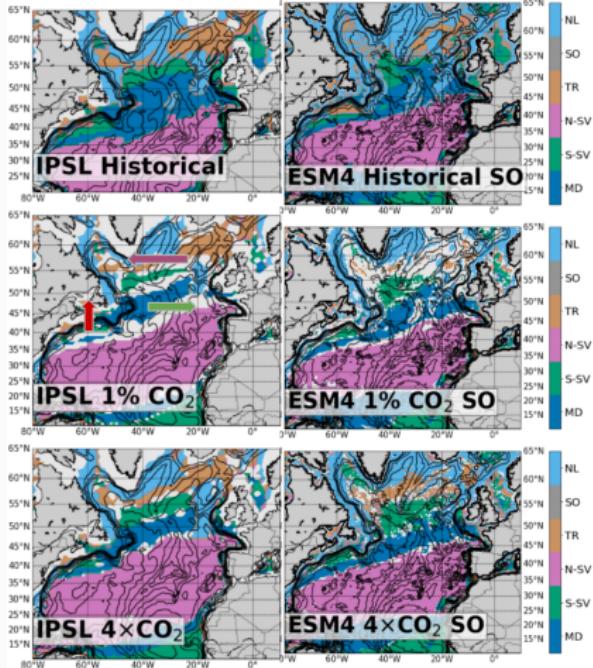

- IPSL (Fr.) and GFDL-ESM (USA)
- Perturbation from 'historical'
- Moderate pace increase: 1% CO₂
- Abrupt increase: 4x Abrupt CO₂

THOR reveals:

- USA east coast current shift (Gulf Stream)
- Heat delivery not as far north (Trans Atlantic Current)
- Areas of waters sinking shift
- Stronger in IPSL
- 4x Abrupt CO₂ bigger change

Model mechanism
intercomparison is facilitated

Tracking Global Heating with Ocean Regimes: C

Circulation is known to weaken with climate change: Mechanisms?

Two example IPCC climate models:

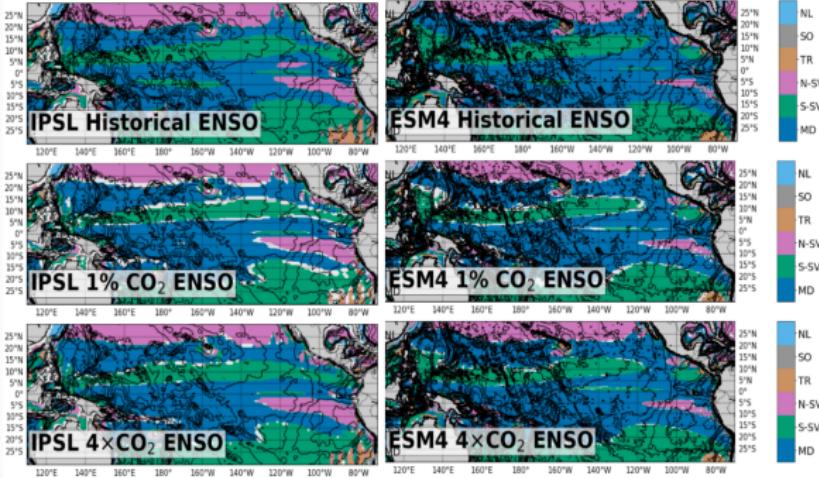

- IPSL (Fr.) and GFDL-ESM (USA)
- Perturbation from 'historical'
- Moderate pace increase: 1% CO₂
- Abrupt increase: 4xAbrupt CO₂

THOR reveals:

- USA east coast current shift **north** (Gulf Stream)
- **Heat delivery** not as far north (Trans Atlantic Current)
- Areas of dense water **sinking** shift
- **Stronger** in IPSL
- 4xAbrupt CO₂ **bigger** change

Model mechanism intercomparison is facilitated

Tracking Global Heating with Ocean Regimes: C

Change less clear:
Mean state brings variability

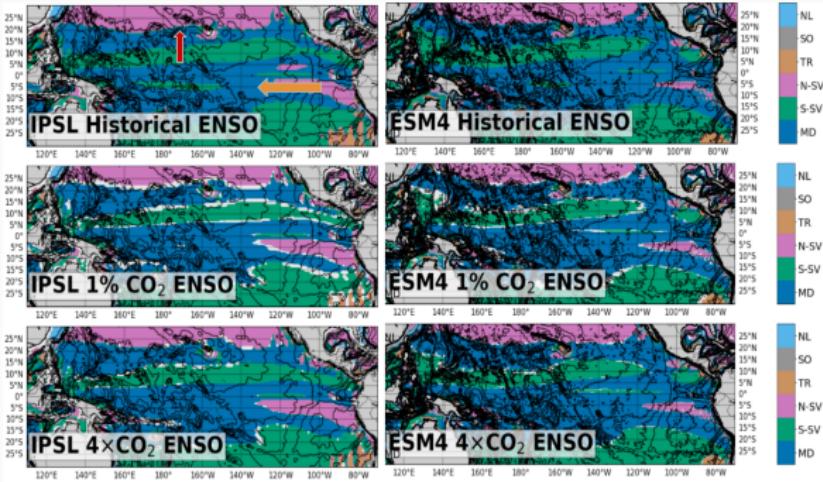

THOR reveals:

- Widening of upwelling by Peru: Cold water delivery
- Expansion of wind-driven polewards transport

Model comparison:

- Bigger difference in dynamics
- Reflection of model configuration?
- IPSL largest change

Tracking Global Heating with Ocean Regimes: C

Change less clear:
Mean state brings variability

THOR reveals:

- Widening of upwelling by Peru: Cold water delivery
- Expansion of wind-driven polewards transport

Model comparison:

- Bigger difference in dynamics
- Reflection of model configuration?
- IPSL largest change

Summary + open questions

THOR strives for transparency:

- 1: Has **interpretable AI** first step with equation transform and clustering
- 2: Engineers labeled dataset grounded in oceanographic theory and utility
- 3: Dataset allows an **Ensemble MLP** to be verified for **theoretical conformance**

Climate analysis appropriate:

- THOR's theory conformance boosts confidence in out-of-sample application
- Avenue for CMIP6 data dissemination+analysis?
- **Blueprint** for other analysis: Monsoon, marine biogeochemistry

Open questions for the ML community:

- XAI methods are **sometimes unreliable** (adversarial attacks, design choices..)
- An Ensemble MLP can be replaced by other ML techniques, but need an estimate of **uncertainty** too

The image shows two tweets from Zachary Lipton (@zacharylipton) on Jun 17. The first tweet discusses the state of "explainable AI" and the lack of understanding between those who can create it and those who use it. It has 22 replies, 113 retweets, and 602 likes. The second tweet discusses a potential negative feedback loop where people who understand the field are less likely to participate, leading to confusion compounds. It has 1 reply, 1 retweet, 64 likes, and a share icon.

Zachary Lipton @zacharylipton · Jun 17

It's hard to underestimate just how strange the state of "explainable AI" is today. For nearly all "local explanation" techniques, the only people who understand them would never use them, and the only people who use them do not understand them.

22 113 602 ...

Zachary Lipton @zacharylipton · Jun 17

Perhaps scariest, there's a negative feedback loop whereby people who understand the state of the field tend not participate in it (nominally), and thus confusion compounds.

Abstract.

Progress within physical oceanography has been concurrent with the increasing sophistication of tools available for its study. The incorporation of machine learning (ML) techniques offers exciting possibilities for advancing the capacity to predict and understand the ocean's behavior, both in the short and midtimescales discourses. Beyond vast amounts of complex data ubiquitous in many modern scientific fields, the study of the ocean poses a conundrum of unique challenges. The ocean is a large system, with observations being largely spatially sparse, limited to the surface, and with few time series spanning more than a handful of decades. Important timescales span seconds to millennia, with some processes being driven by slow internal feedbacks, while others are driven by details such as tides. This review covers the current scientific insight offered by applying ML and points to where there is immense potential. We cover the basic concepts of ML, the types of ML models used in oceanographic modeling. Highlighting both challenges and opportunities, we discuss both the historical context and recent ML tools. We focus on the use of ML in situ sampling, model assimilation, and forecasting, and how ML in oceanography can advance theoretical oceanographic explanation, as well as aid numerical simulations. Applications that are also covered include model error and bias correction, uncertainty quantification, and parameter estimation. Overall, ML without risk, there is great interest in the potential benefits of oceanographic ML applications; this review caters to this interest within the research community.
